1.2 Deep Learning

1.2.1 Chinese Version

1. (a) Introduction

   (b) Overview of CV on Image Classification
2. Neural Network
3. CNN

4. (a) Training a Neural Network
   (b) Better Accuracy
   (c) Optimizer
   (d) Regularization
   (e) Nuts and Bots of Deep Learning
5. Advanced CNN Architecture
6. (a) RNN
   (b) Transformer
   (c) Vision Transformer
7. (a) Pruning
   (b) Quantization
   (c) Tensor decomposition
   (d) Low complexity model
8. (a) Semantic Segmentation
   (b) Object Detection
   (c) Object Detection New Trends
9. (a) GAN
   (b) Diffusion Model
10. (a) Pretrained Model and LLM
    (b) Self Supervised Learning

1.2.2 English Version

1. (a) Welcome to the magic world of Deep Learning
   (b) What is Deep Learning, how it works, why it works and why now?
2. (a) Setting up Deep Learning Environment
3. (a) Machine Learning fundamentals
   (b) ML boosting algorithms XGBoost, CatBoost and LightGBM
   (c) Time series challenges in machine learning. Cross validation and bootstrapping
   (d) Boosting algorithms with PyCaret (XGBoost, Catboost and lightGBM)
4. (a) Deep Neural Networks basics
   (b) Deep Neural Networks Regularization techniques
   (c) Deep Neural Networks with Python Tensorflow
5. (a) Deep Computer Vision Basics
   (b) Deep computer vision, CNN and different convolution operations
   (c) What CNN architecture? Interpretable CNN and Transfer Learning in computer vision
   (d) Advance computer vision: Object detection & segmentation & captioning
   (e) basic CNN using MNIST data and Tensorflow
   (f) CNN & data augmentation using Fashion MNIST
   (g) Transfer learning with TensorFlow using real world images

6. (a) Deep Sequence Modeling: what is RNN and why should we go beyond it
   (b) Deep Sequence Modeling: What is LSTM and bidirectional LSTM?
   (c) NLP: How to prepare text data correctly
   (d) Master Multi-Feature Timeseries Forecasting with LSTM in TensorFlow
   (e) IMDB Sentiment Analysis: Bag of Words vs Sequence Models in TensorFlow
7. (a) The Essential Transformers Prerequisites! Why Attention is All You Need
   (b) Unleash the Power of Transformers Architecture: Ultimate Deep Dive
   (c) Unlock the Power of Custom Transformers: IMDB Text Classification in TensorFlow

1.3 Deep Forecasting

1.4 Machine Learning

1.5 Causal Data Science

1. Introduction
2. Markov Equivalence Class and D-Separation
3. Markov Equivalence Class and Ancestral Graphs
4. Partial Ancestral Graph and Fast Causal Inference Algorithm
5. Conditional Independence Tests & Possible D-Separating Sets
6. Midterm Review
7. Effect Identification
8. Adjustment Criterion for PAGs
9. Do Calculus
10. ID Algorithm
11. ID Algorithm for PAGs
12. Counterfactuals and Effect Estimation

1.6 Mathematics of Deep Learning

1. The Curse of Dimensionality in Machine Learning
2. Function Approximation. Linear vs Non-Linear Approximation
3. Universal Approximation Theorem for Shallow Nets. Harmonic Analysis for Shallow Nets
4. Reproducing Kernel Hilbert Spaces
5. Learning in the Overparametrised Regime. Generalisation Bounds for Normed spaces
6. Convex Optimization Reminders
7. Optimization in Shallow Spaces: the linear regime. The Neural Tangent Kernel
8. Nonlinear overparametrised regime. Mean-Field description
9. Lower bounds: Statistical-Queries, Reductions
10. Depth Separation
11. Invariances and Symmetries
12. Implicit Regularisation. Noisy dynamics. Gradient Flow vs Gradient Descent vs Stochastic Gradient Descent
13. Generative Modeling: Diffusion

1.7 Bio-Inspired AI and Optimization

1. (a) Introduction to the Course & Its Policies & Its Motivation
   (b) Evolutionary Approach to Engineering Design Optimization
   (c) Population Genetics of Evolutionary Algorithms
   (d) The Four Forces of Evolution and The Drift Barrier
   (e) The Basic Genetic Algorithm and Its Implementation
   (f) GA Wrap: Options for Selection & Crossover & Mutation & Extensions
2. (a) Evolutionary Computing from Optimization to Programming
   (b) Genetic Programming, Immunocomputing & Artificial Immune Systems
   (c) Immunocomputing: Genetic Approaches for Diverse Solution Portfolio
3. (a) Multi-Criteria Decision Making, Pareto Optimality & Intro to MOEA
   (b) Multi-Objective Genetic Algorithms: Weight/Vector-Based Approaches

(c) Pareto Ranking and Moving from Communities to Meta-Populations

4. (a) From DGA/PGA to Niching Methods for Multi-Modal Optimization
   (b) Niching Methods in Multi-Modal Optimization

5. (a) Introduction to Simulated Annealing and Entropy
   (b) From Maximum Entropy Toward Optimization by Sim Annealing
   (c) Toward SA: Intro to Boltzmann Sampling and Monte Carlo Integration
   (d) Simulated Anneal & Wrap and Introduction to Ant Colony Opt

6. (a) Ant Colony Opt. and Intro. to Bacterial Foraging Opt.
   (b) Bacterial Foraging Opt. & Particle Swarm Optimization

7. (a) Neural Foundations of Learning
   (b) Feeding Forward from Neurons to Networks
   (c) Recurrent Networks and Temporal Supervision
   (d) Reinforcement Learning: Active Learning in Rewarding Environments
   (e) Learning without Teacher: Unsupervised & Self-Supervised Learning
   (f) Spiking Neural Networks and Neuromorphic Computation

8. (a) Complex Systems Models of Computation: Cell. Automata & Neighbors

1.8 Physics Informed Machine Learning

1. Physics Informed Machine Learning High Level Overview of AI and ML in Science and Engineering
2. AI/ML+Physics A: Choosing what to model
3. AI/ML+Physics B: Curating Training Data
4. AI/ML+Physics C: Designing an Architecture
5. AI/ML+Physics D: Crafting a Loss Function
6. AI/ML+Physics E: Employing an Optimization Algorithm
7. AI/ML+Physics: Recap and Summary
8. AI/ML+Physics: Preview of Upcoming Modules and Bootcamps
9. Deep Learning to Discover Coordinates for Dynamics: Autoencoders & Physics Informed Machine Learning

10. Sparse Identification of Nonlinear Dynamics A: Sparse Machine Learning Models 5 Years Later
11. Sparse Nonlinear Dynamics Models with SINDy B: Training Data & Disambiguating Models
12. Sparse Nonlinear Dynamics Models with SINDy C: Effective Coordinates for Parsimonious Models
13. Sparse Nonlinear Dynamics Models with SINDy D: The Library of Candidate Nonlinearities
14. Sparse Nonlinear Dynamics Models with SINDy E: The Optimization Algorithms
15. Discrepancy Modeling with Physics Informed Machine Learning
16. Hamiltonian Neural Networks
17. Lagrangian Neural Network
18. Neural Implicit Flow
19. Neural ODEs
20. Python Symbolic Regression
21. Residual Networks
22. Fourier Neural Operator
23. Deep Operator Networks
24. Physics Informed Neural Networks

1.9 Nonconvex Optimization for Deep Learning

10. 10
11. 11

1.10 Artificial Intelligence in the Sciences and Engineering

1.10.1 AISE24

1. Course Introduction
2. Introduction to Deep Learning A
3. Introduction to Deep Learning B
4. Importance of PDEs in Science
5. PINNs: Introduction
6. PINNs: Limitations and Extensions A

7. PINNs: Limitations and Extensions B
8. PINNs: Theory A
9. PINNs: Theory B
10. Introduction to Operator Learning A
11. Introduction to Operator Learning B
12. Fourier Neural Operators
13. Spectral Neural Operators and Deep Operator Networks
14. Convolutional Neural Operators
15. Time-Dependent Neural Operators
16. Large-Scale Neural Operators
17. Attention as a Neural Operator
18. Windowed Attention and Scaling Laws
19. Introduction to Hybrid Workflows A
20. Introduction to Hybrid Workflows B
21. Neural Differential Equations NODE
22. Introduction to Diffusion Models
23. Introduction to JAX
24. Symbolic Regression and Model Discovery
25. Applications of AI in Chemistry and Biology A
26. Applications of AI in Chemistry and Biology B
27. Materials

1.10.2 AISE25

1. Course Introduction
2. Introduction to Deep Learning
3. Physics-Informed Neural Networks
   (a) Introduction
   (b) Theoretical Insights
4. Operator Learning
   (a) Introduction
   (b) FNO
   (c) ReNO
   (d) Operator Transformer
   (e) Graph-based Model
   (f) GAOT
5. Generative model for PDE: GenCFD
6. Foundation models of PDEs: Poseidont
7. Applications of AI in Chemistry Biology: A B

1.10.3 Physics-Informed Neural Networks

1. Physics-Informed Deep Learning
   (a) Automatic Differentiation (b) Part B (c) Part C
2. Physics-Informed Deep Learning for Inverse Problems
   (a) Part A (b) Part B
3. Some Applications of PIDL
4. Operator Learning

1.10.4 Kolmogorov-Arnold Networks

1. Kolmogorov-Arnold Networks
2. Efficient training of Kolmogorov-Arnold Networks
3. Sparsity and Symbols with Kolmogorov-Arnold Networks
4. A Revisit of Kolmogorov's mapping theorem for Neural Network

1.10.5 Transformers from an Optimization Perspective

1.11 High Dimensional Analysis: Random Matrices and Machine Learning

1. Introduction and Survey
2. Volumes in High Dimensions
3. Concentration of Volumes
4. Gaussian Random Vectors and Concentration of Their Norm
5. Exponential Concentration of Norm of Gaussian Random Vectors
6. Non-Linear Concentration of Gaussian Random Vectors for Lipschitz Functions
7. Proof of Non-Linear Concentration for Gaussian Random Vectors
8. General Remarks on Linear and Non-Linear Concentration Inequalities
9. Wishart Random Matrices and Concentration of Largest Eigenvalue
10. Proof of Concentration of Largest Eigenvalue
11. The Marchenko-Pastur Law for Wishart Matrices
12. Preparations for Proof of Marchenko-Pastur Law
13. Proof of Marchenko-Pastur: Equation for Stieltjes Transform
14. Proof of Marchenko-Pastur: Stieltjes Inversion Formula
15. Spiked Signal-Plus-Noise Model
16. Proof of the Signal-Plus-Noise Theorem
17. Double Descent and Linear Regression: Over-Determined Case

18. Double Descent and Linear Regression: Under-Determined Case

19. General Remarks on Random Feature Model

20. Asymptotic Eigenvalue Distribution in the Random Feature Model

21. Another Proof of Marchenko-Pastur – Via Stein's Identity

22. Resolvent Method and Cumulant Expansion

23. Cumulants and Their Properties and Uses

24. Calculation of the Random Feature Eigenvalue Distribution

25. Gaussian Equivalence Principle for Non-Linear Random Features

26. Gradient Descent for Linear Regression

27. Time Evolution of Learning and Neural Tangent Kernel

28. Properties of the Neural Tangent Kernel

29. Free Probability Theory and Linearization of Non-Linear Problems

30. The curse and the blessing of high dimensions

2 Physics

2.1 Solar Physics

1. The Sun A: Internal Structure and Photosphere
2. The Sun B: Chromosphere and Transition Region
3. Long Term Solar Activity
4. Coronal Phenomenology
5. Techniques for Ground-Based Optical Observations of the Sun
6. Imaging the Solar Corona
7. Solar Eruptive Phenomena
8. Overview of Observational Methods and Instruments A: Spectrographs
9. Overview of Observational Methods and Instruments B: Solar Radio Observations
10. Fundamentals of Magnetohydrodynamics (MHD)
11. Solar Irradiance
12. Coronal Heating
13. Solar Wind and Heliosphere
14. Solar Irradiance and Upper Atmospheres

讲座:

1. paraview 可视化教程
2. 太阳活动区磁场外推模型
3. Jhelioviewer + AIA 各波段
4. AI 驱动的太阳耀斑预报模型研究
5. 空间天气日冕行星际数值模拟研究
6. 一种非线性无力场外推 Wiegelmann 方法
7. 太阳活动区的数据驱动模式及其在太阳爆发物理和预报中的应用
8. Predicting Solar Flares with Machine Learning

9. Finding the Right Metric Solar Flare Forecast Evaluation
10. Does Imaging of Time Series Help Flare Forecasting
11. Solar Flares Prediction with Machine Learning
12. Statistical Methods for Solar Flare Prediction
13. Video Imputation and Prediction in Space Weather
14. Data-Analytic Opportunities and Challenges in Solar Eruption Forecasting
15. Prediction of Solar Events Using Vector Magnetic Fields and Machine Learning
16. Solar System Ambassadors Coronal Magnetism, Mass Ejections and Space Weather Prediction
17. Computational Modeling for 3D Data Reconstruction of Solar Coronal Magnetic Fields
18. Nonlinear Force-Free Fields and Coronal Magnetic Field Modeling
19. Physics-Informed Neural Networks for Solar Magnetic Field Simulations
20. A Novel Physics-Informed ML Method for 3D Solar Photosphere Reconstruction
21. Recent Progress in Understanding Solar Flare Magnetism using Data-Driven Simulations and Statistical Analysis of Vector Magnetic Fields
22. Our Magnetic Sun and its Influence Across the Solar System
23. Heliophysics Big Year Workshop Coronal Magnetic Field Modeling
24. Data Driven Models for Coronal Magnetic Field Aditya-L1 Perspective
25. Testing the Physics of Solar and Stellar Flares with Extreme UV Observations and Radiative MHD Simulations
26. Solar Magnetic Fields Before and During Eruptions
27. Solar Flares: Nature's Laboratory for Magnetic Reconnection
28. Solar Flare Observations and Model Predictions for the Next Solar Magnetic Activity Maximum
29. Plasma Physics of the Turbulent Solar Corona: Old Questions, New Eyes
30. Generation of Magnetic Field in the Sun and Stars. Why Are We Still Arguing?

2.2 Quantum Mechanics

2.2.1 1

1. Chapter 1 Introduction
2. Chapter 2 U(1) representations
3. Chapter 3 Two-state systems and SU(2)
4. Chapter 4 Linear algebra
5. Chapter 5 Lie Algebras and Lie Algebra Representations
6. Chapter 6 Rotations and Spin in 3 dimensions
7. Chapter 7 Rotations and Spin 1/2 in a Magnetic Field
8. Chapter 8 Representations of SU(2) and SO(3)
9. More Chapter 8
10. Chapter 9 Tensor Products
11. Chapter 10 Momentum and the Free Particle
12. Chapter 11 Fourier Analysis and the Free Particle
13. Chapter 12 Position and the Free Particle
14. Chapter 13 The Heisenberg group and the Schrodinger representation
15. Chapters 14 and 16 Poisson brackets and the symplectic group
16. Chapter 16 Quadratic polynomials and the symplectic sroup
17. Chapter 15 Hamiltonian vector fields and the moment map
18. Chapter 17 Quantization
19. Chapter 18 Semi-direct products
20. Chapter 19 Representations of the Euclidean group and the free particle
21. Chapter 20 Representations of semi-direct products
22. Chapter 21 Central potentials and the Hydrogen atom
23. Chapter 22 The Harmonic Oscillator

24. Chapter 23 Coherent states

25. Review

2.2.2 2

1. Chapters 24-26 Canonical quantization, second semester overview

2. Chapters 27 and 28 Fermionic oscillators, Weyl and Clifford algebras

3. Chapter 29 Clifford algebras and geometry

4. Chapter 30 Anticommuting variables and pseudo-classical mechanics

5. Chapter 31 Fermionic quantization and spinors

6. Chapters 32 and 33 Complex structures and supersymmetry

7. Chapter 33 Supersymmetric quantum mechanics

8. Chapter 34 The Pauli equation and the Dirac operator

9. Chapter 35 Lagrangian methods and the path integral

10. Chapter 36 Multi-particle systems: momentum space

11. Chapter 37 Multi-particle systems and field quantization

12. Chapters 25-26 Review of symmetries and quadratic operators

13. Chapter 38 Symmetries and non-relativistic QFT

14. Chapter 40 Minkowski space and the Lorentz group

15. Chapter 41 Representations of the Lorentz Group

16. Chapter 42 The Poincare group and its representations

17. Chapter 43 The Klein-Gordon equation and scalar quantum fields

18. Chapters 43 and 44 Symmetries and propagator for scalar fields

19. Chapters 43 and 44 More symmetries and propagators for the scalar field

20. Chapter 45 U(1) gauge symmetry and electromagnetic fields

21. Chapter 46 Quantization of the electromagnetic field

22. Chapter 46 More on quantization of the electromagnetic field

23. Chapter 47 The Dirac equation and spin 1/2 fields

24. Chapter 47 More on the Dirac equation and spin 1/2 fields

25. Chapter 48 The Standard Model

2.3 Quantum Field Theory

2.3.1 1

1. Introductory words; using a model of a crystalline solid to discover QFT

2. Discovery of Fock space

3. Scalar field theory with some extra adjectives

4. Quantization of the radiation field by analogy; Noether's theorem and its converse

5. Casimir effect; fields mediate forces

6. Fields mediate forces; Wick rotation and time-ordering

7. Big picture recap; Feynman diagrams in 0+0-dimensional QFT

8. Lorentz invariance and causality

9. Path integral subtlety; propagators; where is single-particle QM in QFT?

10. The S-matrix and Dyson expansion

11. Wick's theorem; time-ordered Green's functions and diagrams

12. The exponentiation of the disconnected diagrams

13. The LSZ reduction formula

14. Observable physics from the S-matrix

15. Observable physics from the retarded Green's function; Group theory

16. Representations of the Lorentz group on fields

17. Spinor Lagrangians

18. The quanta of a spinor field are fermions

19. Scattering of fermions

20. Vector fields and gauge invariance

2.3.2 2

1. Goals, parable on violation of scale invariance by QM
2. Beta function; a simple example of perturbative renormalization
3. First steps towards quantum corrections to the Coulomb force law
4. Electron self energy; self-energy in phi^4 theory
5. Where is the cutoff dependence?
6. QED vertex correction
7. Soft photons
8. Vacuum polarization
9. Spectral density
10. Optical theorem and cutting rules
11. Hadrons with perturbative QCD; Parable on integrating out heavy modes
12. Anderson-Higgs mechanism
13. Interlude on differential forms
14. Gauge fields as connections; fermion path integrals
15. Lattice gauge theory
16. Gauge fixing
17. The QCD beta function
18. Wilsonian RG, briefly
19. Renormalization of composite operators; Callan-Symanzik equation; Introductory words about Effective Field Theory
20. The color of the sky; loops in effective field theory; the Standard Model as an effective field theory

2.3.3 3

1. Goals; Anomalies
2. Anomalies; emergence of the Dirac equation in 1+1d
3. More anomalies
4. Effective field theory of gravity and of particle physics
5. Effective field theory of superconductors and superfluids
6. Effective field theory of metal
7. Effective field theory of metal, continued
8. Coherent state path integrals for bosons and fermions
9. Path integrals and sums for spins; geometric quantization
10. Coherent state parth integrals for spins
11. Topological terms from integrating out fermions; pions
12. More on pions
13. Nucleons as solitons; Field theory of spin systems
14. Field theory of the Neel phase
15. Large N
16. Transverse-field Ising model
17. Field theory of the transverse-field Ising model
18. Superfluid-insulator transition and T-duality
19. Bosonization
20. Holographic duality

2.4 Spacetime and Geometry

1. Course Overview
2. Spacetime or Timespace
3. Index Calculations, Summation, an Example from Vector Algebra

4. Lorentz Transformations and Euclidean Isometries
5. Newtonian Space and Minkowski Space
6. Tensor Calculations in Minkowski Space and More
7. 4-Vectors and Physics in Special Relativity
8. Maxwell's Equations
9. Lagrangian Mechanics
10. Classical Field Theory
11. (a) Equivalence Principle Sketched
    (b) On Calculus on Manifolds, a Lightning Tour
12. Metric on Spacetime
13. Overview of Curvature and Einstein's Field Equations
14. (a) Covariant Derivatives and Curvature from Frankel
    (b) Covariant Derivatives and Curvature from Carroll
15. Variational Calculus and Geodesics
16. Einstein's Equations and a Word on Generalizations of GR
17. Schwarzschild Solution
18. Gravitational Waves
19. Cosmological Models
20. (a) Tetrad Method, Lorentzian frames
    (b) Calculating Curvature via Tetrad Formalism, Future Reading

2.5 Gravitational Wave Astrophysics

1. Intro & GR recap
2. Black Holes
3. Lin Gravity A
4. Lin Gravity B
5. Lin Gravity C
6. Binary Inspiral
7. Binary GWs CO Formation
8. Neutron Stars

9. Data Analysis 1
10. Data Analysis 2
11. BBH Observations
12. BNS Observations
13. NSBH Observations
14. Other GW Results
15. Future of GW

2.6 Radiative and Dynamical Processes

1. Introductory Course Overview
2. (a) Random Walks and Diffusion
   (b) Brownian Motion and Langevin Equation
3. (a) Intro to Plasma; Coulomb Collisions
   (b) Coulomb Collision Rates
4. (a) Kinetic Theory, Liouville's Theorem
   (b) Boltzmann Collision Term; Fokker-Planck Equation
5. (a) Fluid Moments of the Boltzmann Equation
   (b) Adiabatic Thermodynamics; Intro to MHD; Magnetic Pressure and Tension
   (c) Ideal and Resistive MHD; The Induction Equation
6. (a) Ideal MHD Applications; Potential and Force-Free Fields
   (b) Ideal MHD Applications: MHD Waves and Instabilities
7. (a) Transport Coefficients in Non-Ideal MHD
   (b) Beyond MHD; Magnetic-Field Anisotropies and Ambipolar Diffusion
8. (a) Dynamics: Work, Energy, and Euler-Lagrange Theory
   (b) 2-Body Keplerian Motion Derived from Lagrangians
   (c) Astrophysical Applications of 2-Body Orbits
9. (a) Finish 2-Body Applications. 3-Body Problem: Roche Lobes, Hill Stability
   (b) Trojan Lagrange Points, Tidal Distortions, Tidal Heating
10. (a) N-body Gravitational Dynamics; Collisional Relaxation; Gravitational Focusing
    (b) N-body Collisionless Potentials; Oort Constants; the Milky Way
    (c) N-body Virial Theorem; Applications in Stars and Galaxy Clusters

11. (a) Radiation Processes: Intensity, Flux, and Magnitudes
    (b) Radiation Moments; Bose-Einstein Statistics; Equation of Radiative Transfer
    (c) Opacity Sources; Optical Depth; LTE and Non-LTE
    (d) Solving the RT Equation for a Gray Atmosphere; Exploring Its Properties
12. (a) Radiative Transfer in Non-Gray, Non-LTE, and Non-Plane-Parallel Cases
    (b) Radiative Transfer for Spectral Lines: Opacities and Einstein Relations
    (c) Spectrum Formation and Multiple Sources of Line Broadening
    (d) Ionization and Recombination; Irradiated Planetary Atmospheres
    (e) Greenhouse Effect; Radiation Pressure; Poynting-Robertson Drag

2.7 Special Relativity from a Mathematician's Point of View

1. 1 2. 2 3. 3 4. 4 5. 5 6. 6

3 Algebra

3.1 Set Theory

3.2 Linear Algebra

3.2.1 Linear Algebra I

1. Fields, Vector Spaces, Subspaces.
2. Subspaces, Linear Dependence, Basis.
3. Linear Dependence, Basis.
4. Basis, Replacement Theorem, Dimension.
5. Linear Transformation, Kernel, Range, Dimension Theorem.
6. Dimension Theorem, Projection.
7. Matrix Representations.
8. Matrix Representations, Invertible Linear Transformations.
9. Invertible Linear Transformations, Change of Coordinates.
10. Elementary Matrices.
11. Elementary Matrices, Gaussian Elimination.
12. Gaussian Elimination, Determinant of Order 2.
13. Determinants.
14. Determinants(in Terms of Permutations),Cramer's Rule,Adjoint Matrices.
15. Diagonalization
16. Diagonalization
17. Invariant Subspaces, Cayley-Hamilton Theorem
18. Jordan forms, generalized eigenspaces (w. notes)
19. Jordan forms
20. Jordan forms.

21. Jordan forms.
22. Exponential of matrices
23. Systems of first order differential equations, minimal polynomials.
24. Rational canonical forms.
25. Rational canonical forms.
26. Rational canonical forms.

3.2.2 Linear Algebra II

1. Dual Spaces
2. Quotient Spaces
3. Inner Product Space
4. Inner Product Space, Gram-Schmidt Process
5. Orthogonal Projection
6. Hilbert Space, Riesz Representation Theorem
7. Riesz Representation Theorem
8. Adjoint Operators, Normal Operators
9. Normal and Self adjoint Operators
10. Positive semidefinite, Orthogonal and Unitary operators
11. Orthogonal and Unitary operators
12. Orthogonal projection, Spectral theorem
13. Spectral theorem,Simultaneous diagonalization of normal operators
14. Singular value decomposition, Polar decomposition
15. Pseudoinverse
16. Pairs of commuting matrices over a finite field
17. Pairs of commuting matrices over a finite field
18. Bilinear forms

19. Bilinear forms, Quadratic forms
20. Quadratic forms
21. Quadratic spaces
22. Quadratic spaces
23. Witt decomposition theorem
24. Cartan-Dieudonné theorem
25. Cartan-Dieudonné theorem
26. Bézout's theorem
27. Bézout's theorem

3.3 Number Theory

3.4 Abstract Algebra

3.4.1 Algebra I

1. Basic notion, Symmetry groups
2. Cosets, Normal Subgroups, Quotient Groups, Isomorphism Theorem
3. Isomorphism Theorem, Tower of Subgroups
4. Butterfly lemma, Jordan-Hölder theorem
5. Jordan-Hölder theorem, Cyclic groups
6. Group Action, Simpleness of A_n
7. Simpleness of A n, Sylow theorems
8. Sylow theorems
9. Semidirect products
10. Structure theorem of finite abelian groups
11. Ring Isomorphism Theorem
12. Chinese Remainder Theorem, Localization

13. ED, PID, UFD
14. Gauss lemma, Criteria for irreducibility
15. Algebraic extensions
16. Algebraic closures
17. Algebraic closures, Normal extensions
18. Separable extensions
19. Primitive element theorem, Finite fields
20. Galois theory
21. Galois theory
22. Galois theory, roots of unity, cyclotomic extensions.
23. Norms and traces.
24. Purely inseparable extensions, cyclic extensions.
25. Solvable extensions, solvable by radicals.

3.4.2 Algebra II

1. Module theory.
2. Free modules, projective modules.
3. Modules over PID.
4. Modules over PID.
5. Tensor products.
6. Modules of fractions.
7. Noetherian modules.
8. Primary decompositions.
9. Primary decompositions, Nakayama's lemma.
10. Nakayama's lemma, filtered and graded modules, Artin-Rees.
11. Hilbert polynomial, Artinian modules.

12. Abelian categories, general homology theory.
13. Injective modules.
14. Homotopies of morphisms of complexes, derived functors.
15. Ext functor.
16. Ext functor, Ext^1, Tor functor.
17. Group cohomology.
18. Group cohomology, Semisimple modules.
19. Semisimple modules, Semisimple rings.
20. Density theorem, Wedderburn theorem, Burnside theorem.
21. Representations, Characters.
22. Characters, Class functions.
23. Orthogonality relations.
24. Orthogonality relations.
25. Induced characters, Induced representations.
26. Induced representations, Mackey's criterion.
27. Artin theorem, Brauer theorem.

3.5 Matrix Lie Groups and Lie Algebra

3.5.1 Matrix Lie Groups

1. Complex and Quaternions A
2. Complex and Quaternions B
3. More Quarternions, Group Theory A
4. More Quarternions, Group Theory B
5. Chapter 2 and Isometries over R,C and H A
6. Chapter 2 and Isometries over R,C and H B
7. Path Connectedness for SO(n) and SU(2) A
8. Path Connectedness for SO(n) and SU(2) B
9. Lie Groups and Tangent Space at I A
10. Lie Groups and Tangent Space at I B

11. What is the Logarithm A
12. What is the Logarithm B
13. On the Derivative of a Homomorphism
14. Adjoint and Lie Algebra A
15. Adjoint and Lie Algebra B
16. Lie Algebra Example 2nd Order BCH A
17. Lie Algebra Example 2nd Order BCH B
18. BCH identity A
19. BCH identity B
20. BCH calculation A
21. BCH calculation B
22. Universal Covers and Lie's Theorem A
23. Universal Covers and Lie's Theorem B
24. Group Orbits and Homogeneous Space A
25. Group Orbits and Homogeneous Space B

3.5.2 Lie Algebra

1. Introduction to Lie Groups with Focus on Matrix Groups A
2. Introduction to Lie Groups with Focus on Matrix Groups B
3. Introduction to Lie Groups with Focus on Matrix Groups C
4. Definition, Examples, Lie Subalgebra, Ideals, Adjoint Homomorphism
5. Adjoint Homomorphism, Structure Constants, Cross Product Lie Algebra
6. Ideals, Low Dimensional Lie Algebras, Derived Algebra, Solvable, Radical A
7. Ideals, Low Dimensional Lie Algebras, Derived Algebra, Solvable, Radical B
8. Ideals, Low Dimensional Lie Algebras, Derived Algebra, Solvable, Radical C
9. Solvable, Nilpotent and Simple Lie Algebras A
10. Solvable, Nilpotent and Simple Lie Algebras B
11. Lemmas, Engel and Lie's Theorems, Lie Algebra Homomorphism, Modules A
12. Lemmas, Engel and Lie's Theorems, Lie Algebra Homomorphism, Modules B
13. Representations, Factor Modules, Irreducible Submodules A
14. Representations, Factor Modules, Irreducible Submodules B
15. Schur's Lemma, SL(2,C) Representation on Vd Begins
16. SL(2,C) Representation on Vd Continued, Irreducibility Confirmed

4 Analysis

4.1 Wavelet

4.2 Linear Analysis

1. Introduction
2. Power Series
3. Series Solutions at Ordinary Points
4. Series Solution to Airy's Equation
5. Legendre Series
6. Frobenius Series Theory
7. Frobenius Series Example
8. General Frobenius Theory: Setup
9. General Frobenius Theory: The Theorem
10. Frobenius Theory
11. Functions as vectors
12. Bessel Equations: Intro
13. Bessel Equations: Theory
14. Bessel equations: Computation
15. Step-by-step Frobenius problems
16. Motivation for Fourier Series
17. Periodic functions and sinusoids
18. Complex exponentials
19. Fourier series basics
20. Finite Fourier series
21. Finding Fourier Coefficients 1
22. Finding Fourier Coefficients 2
23. Finding Fourier Coefficients 3
24. Convergence and Complex Exponentials as a basis
25. Finding Fourier Coefficients Examples
26. Fourier's Solution to the Heat Equation
27. Fourier Transform
28. Fourier Transform Examples
29. Office Hours 1
30. Office Hours 2
31. Convolution and the Fourier transform
32. The Fourier Transforms and Differential Equations
33. The Laplace Transform
34. The Laplace transform and Differential Equations
35. The first shifting theorem
36. Step functions and the second shifting theorem
37. Delta functions and convolution

4.3 Complex Analysis

1. 0920 ntroduction to the course, examples of applications, definition of holomorphic functions,

algebraic stability properties of holomorphic functions.

2. 0921 Convergent power series are holomorphic. Examples and counterexample (the complex conjugate function).

3. 0927 Holomorphy and differentiability; the Cauchy-Riemann equations. Line integrals.

4. 0928 Line integrals and primitives.

5. 1004 Chapter 3: Cauchy's Theorem. Goursat's Theorem, existence of primitives in a circle, Cauchy's Integral Formula.

6. 1005 Chapter 3: proof of Goursat's Theorem.

7. 1011 Chapter 4: applications of Cauchy's Theorem and integral formula: analyticity, Cauchy's inequalities for derivaties, Liouville's Theorem.

8. 1012 Chapter 4: zeros of holomorphic functions, analytic continuation.

9. 1018 Chapter 4: proof of the principle of analytic continuation. Limits of holomorphic functions, Morera's theorem.

10. 1019 Chapter 4: holomorphic functions defined by integrals

11. 1025 Chapter 5: singularities and meromorphic functions, residue theorem.

12. 1026 Chapter 5: residue theorem and examples.

13. 1101 Chapter 5: meromorphic functions, counting zeros, open image and maximum modulus principle.

14. 1102 Chapter 5: meromorphic functions, counting zeros, open image and maximum modulus principle.

15. 1115 Chapter 6: Eta, THeta, Zeta (a long example). Definitions of the functions, infinite products..

16. 1116 Chapter 6: Eta, THeta, Zeta. Analytic continuation of the zeta function, application to prime numbers.

17. 1121 Chapter 6: Eta, THeta, Zeta (a long example). Sketch of Riemann's approach to counting primes; the Riemann Hypothesis.

18. 1123 Chapter 7: Homotopy and applications. Definition and statement of Cauchy's Theorem for homotopic curves.

19. 1129 Chapter 7: Proof of Cauchy's Theorem for homotopic curves.
20. 1130 Chapter 7: simply-connected open sets, existence of primitives. The complex logarithm.
21. 1206 Chapter 7: The residue theorem and homotopy; winding numbers.
22. 1207 Chapter 8: conformal mapping (definition, first examples).
23. 1213 Chapter 8 (conformal mapping): more examples, statement of Riemann's mapping theorem. Outline of the proof. Schwarz Lemma, automorphisms of the disc.
24. 1214 Chapter 8 (conformal mapping); reduction of Riemann's Theorem to the existence of an extremum.
25. 1220 Chapter 8 (conformal mapping): end of the proof of Riemann's Theorem; Montel's Theorem. Final remarks.
26. 1221 Review of the course, questions

4.4 Calculus and Analysis

4.4.1 Calculus I

1. System of real number 1
2. System of real number 2
3. System of real number 3
4. Completeness of Real Number, Weierstrass Theorem 1
5. Weierstrass Theorem 2, define subsequence, Cauchy Sequence
6. Least Upper Bound & Greatest Lower Bound
7. Continuous function, uniformly continuous, Lipchitz continuous
8. Intermediate value theorem, Extreme Value Theory
9. Rieman sum
10. Properties of integral, MVT/general MVT for integral, logarithm
11. Logarithm and exponential 1
12. Logarithm and exponential 2
13. Fundamental Theorem of Calculus 1, Rolle's Theorem, MVT for derivative 1

14. MVT for derivative 2, approximation by linear function, FTC 2
15. Properties of derivative, composite functions, chain rule
16. First/second derivative test
17. Order of magnitude, introduce an smooth function
18. Some example of oscillating functions, chain rule, method of substitution
19. Integration by parts
20. Integration of rational functions 1
21. Integration of rational functions 2, Improper integral 1
22. Improper integral 2
23. Taylor's series: Gamma function, power series, expansion of the logarithm
24. Taylor's series: Taylor's theorem, Cauchy's & Lagrange's remainder
25. Taylor's series: estimate remainder term, expansion of elementary
26. Taylor's series: examples
27. Taylor's polynomial: interpolation 1
28. Taylor's polynomial: interpolation 2, approximation in first order
29. Taylor's polynomial: approximation in second order
30. Taylor's polynomial: fixed point approximation, Stirling's formula
31. Series: concepts of convergence and divergence 1
32. Series: rearrangement, tests for absolute convergence and divergence 1
33. Series: tests for abs. convergence and divergence 2, sequences of functions
34. Series: pointwise/uniform convergence 1
35. Series: pointwise/uniform convergence 2
36. Series: power series, interval of convergence
37. Series: product of two power series
38. Series: expansion of given power series, infinite product

39. Fourier series: periodic function, complex notation 1
40. Fourier series: complex form 2, trigonometric formula, Riemann Lebesgue Lemma
41. Fourier series: examples of Fourier expansion
42. Fourier series: main theorem on Fourier expansion
43. Fourier series: examples of Fourier series 1
44. Fourier series: examples of Fourier series 2, Bessel's Inequality
45. Approximation by trigonometric and rational polynomial 1
46. Approximation by trigonometric and rational polynomial 2
47. Approximation by trigonometric and rational polynomial 3
48. Inner product
49. Bernoulli polynomial and their applications 1
50. Bernoulli polynomial and their applications 2

4.4.2 Calculus II

1. Functions of multiple variables & partial derivative
2. Continuity
3. Differentiability & directional derivative (1)
4. Directional derivative (2) & tangent plane
5. Change of variables & Taylor series
6. MVT & Taylor expansion & Integral
7. Double integral & length of curve
8. Curvature & linear differential one form
9. Line integral
10. Heine-Borel theorem
11. Compact subset & Implicit Function theorem (1)
12. Implicit Function theorem (2)

13. Inverse Function theorem (1)
14. Inverse Function theorem (2) & extreme value
15. Lagrange Multiplier method
16. Examples & Hölder Inequality
17. sufficient condition for local max/min
18. Jordan measurable
19. Jordan area (1)
20. Jordan area (2)
21. Double integral (1)
22. Double integral (2)
23. Transformation of multiple integrals
24. Improper multiple integrals (1)
25. Improper multiple integrals (2) & volumes
26. Surface area
27. Surface area formula
28. Multiple integral in curved coordinate
29. Extend to $\mathbb{R}^n$
30. Integral of unbounded set
31. Fourier integral theorem (1)
32. Fourier integral theorem (2)
33. Fourier transform - decay property & Parseval's identity
34. Fourier transform of several variables
35. Green theorem
36. Divergence theorem
37. Prove Inverse Function theorem by Green theorem

38. Orientation of surface in $\mathbb{R}^3$ I
39. Orientation of surface in $\mathbb{R}^3$ II
40. Gauss theorem in $\mathbb{R}^3$ I
41. Gauss theorem in $\mathbb{R}^3$ II
42. Application of fluid
43. Stoke's theorem
44. General surface (partition of unit) (1)
45. General surface (partition of unit) (2)
46. General surface (partition of unit) (3) & functions of one complex variable
47. Complex function - power series
48. Complex function - differentiability
49. Conformal map & integration of analytic functions - Cauchy's theorem
50. Complex integral theorem & Cauchy integral formula
51. Zeros, poles and residues

4.4.3 Analysis I

1. Real Numbers and the completeness
2. Limits and continuity in metric space
3. Open and closed sets in metric space
4. Topological space & The closure of the set
5. Equivalence of continuous functions & Inheritance Principle & Homeomorphism
6. Product metric spaces & Completeness & Compactness (sequentially compact)
7. Compactness (2) & Bolzano-Weierstrass Thm & Nested seq of nonempty compact sets
8. ontinuous functions and Homeomorphisms on compact sets & Connectedness
9. Some properties in topological spaces
10. Accumulation points and isolated points & Dense & Hausdorff space

11. Properties of Connectedness
12. Path connected & Compactness in metric space, Hausdorff space, Topological space(1)
13. Compactness (2) & Sequentially compact implies compact(open cover) (1)
14. Sequentially compact implies compact(open cover) (2) & Totally bounded (1)
15. Totally bounded (2) & Perfect & Cantor set
16. Cantor surjection Theorem
17. Peano Curves & Riemann integrable & Darboux integrable(1)
18. Darboux integrable(2) & Riemann integrable iff Darboux integrable(1)
19. Riemann integrable iff Darboux integrable(2) & Some integrable functions (1)
20. Some integrable functions (2) & Lebesgue number & Zero set
21. Oscillation & Riemann-Lebesgue Theorem
22. Some applications of R-L theorem
23. Fundamental Theorem of Calculus & Convergence in functional space
24. Complete functional space & Convergence function series & Integrals wst unif conv.
25. Derivatives w.s.t uniform convergence & Equicontinuity and Arzela-Ascoli Theorem
26. Heine-Borel Theorem in a function space & Stone-Weierstrass Theorem
27. Fixed point, contraction and ODE
28. Nowhere differentiable continuous function & Baire' s Theorem
29. Corollary of Baire' s Theorem
30. Multiple integral and Fubini' s Theorem
31. Change of variables formula (1)
32. Change of variables formula (2)
33. Banach spaces
34. Banach algebra
35. Differentiation in Banach Spaces

36. Some examples & Integration in Banach spaces (1)
37. Integration in Banach spaces (2)
38. Inverse function theorem
39. Lebesgue Outer measure
40. Lebesgue measurable set & Abstract outer measure
41. Measurable Sets form Sigma-Algebra & Measure continuity
42. Regularity (1)
43. Regularity (2)
44. Every open set is a countable disjoint union of balls plus a zero set
45. Measure Product & Inner measure (1)
46. Inner measure (2) & Slice Measure (1)
47. Slice Measure (2) & Lebesgue integrable functions & Monotone Convergence Theorem
48. Completed undergraph & Dominated Convergence Thm and Fatou' s Lem & Basic properties
49. Some basic properties of measurable functions (2)
50. Cavalieri's principle & Equivalence measurable function definition & Tonelli Thm
51. Vitali covering Lemma
52. Density Theorem

4.4.4 Analysis II

1. Lebesgue Differentiation Theorem (1)
2. Lebesgue Differentiation Theorem (2) & Absolutely continuous functions
3. Indefinite integral is abs conti. & A monotone function has a derivative a.e. (1)
4. A monotone function has a derivative almost everywhere (2)
5. Riemann integrals vs Lebesgue integrals
6. Bounded variation
7. Equi relation of B-V functions and abs conti functions & R-S integrals (1)

8. Riemann-Stieltjes integral (2)
9. Riemann-Stieltjes integral (3)
10. Riemann-Stieltjes integral (4)
11. L^2 $[a, b]$ space
12. Properties of L^2 $[a, b]$ space
13. Orthogonal basis in L^2
14. Fourier coefficients and Parseval's formula
15. A necessary condition of Fourier series converges in L^1 & Riemann-Lebesgue lemma
16. Dirichlet kernel
17. Dini Theorem & There is a continuous function whose Fourier series diverges (1)
18. There is a continuous function whose Fourier series diverges (2) & U-B Principle
19. There is a continuous function whose Fourier series diverges (3)
20. Some properties of Fourier coefficients & Cesàro summability
21. Fejér's Theorem & Approximate integrable functions by tri-polynomial in L^1 norm
22. The average of Fourier series converges in L^p norm
23. Equi. of the average of Fourier series converges unif & Weakly convergence(1)
24. Weakly convergent(2) & Equi condition for tri-series to be the Fourier series
25. Convergence of Cesàro mean of Fourier series (1)
26. Part2 Conv of Cesàro mean of Fourier series(2), Conjugate Fourier series & Dini theorem
27. Singular integrals and conjugate function
28. Bound of the L^2 norm of conjugate function & Hardy-Littlewood Maximal function
29. Bound of the norm of the supremum of conjugate functions
30. A counterexample & C-Z Decomposition & The conjugate function exists a.e. in L^1
31. The conjugate function exists a.e. in L^1 (2)
32. The conjugate function exists a.e. in L^1 (3) & Weakly estimate

33. Applications of Fourier series -isoperimetric inequality
34. Applications of Fourier series -continuous but nowhere differentiable function
35. Fourier transform and some properties
36. Fourier inversion formula and Minkowski's inequality
37. Poisson summation formula & Roth's theorem on 3-term AP
38. Discrete Fourier series, Fourier transform and some properties (1)
39. Discrete Fourier series, Fourier transform and some properties (2)
40. Bourgain's theorem
41. Proof of Roth's theorem on 3-terms AP (step 1)
42. Proof of Roth's theorem on 3-terms AP (step 2 to step 7)
43. Proof of Roth's theorem on 3-terms AP (step 9 , step 8)
44. Proof of Roth's theorem on 3-terms AP (step 8)
45. There is f in L^1 such that for a.e. x, the Fourier series diverges (1)
46. There is f in L^1 such that for a.e. x, the Fourier series diverges (2)
47. There is f in L^1 such that for a.e. x, the Fourier series diverges (3)
48. There is f in L^1 such that for a.e. x, the Fourier series diverges (4)

4.5 Mathematical Modeling

4.6 Harmonic Analysis and Banach Algebras

4.7 Measure Theory and Functional Analysis

4.7.1 Measure Theory

1. Introduction: a Non-Measurable Set
2. Classes of Subsets (Semi-Algebras, Algebras and Sigma-Algebras), and Set Functions
3. Set Functions
4. Caratheodory Theorem

5. Monotone Classes
6. The Lebesgue Measure I
7. The Lebesgue Measure II
8. Complete Measures
9. Approximation Theorems
10. Integration: Measurable and Simple Functions
11. Measurable Functions
12. Definition of the Integral
13. Integral of Simple Functions
14. Properties of the Integral I
15. Properties of the Integral II
16. Theorems on the Convergence of Integrals
17. Product Measures
18. Measure on a Countable Product of Spaces
19. Fubini's Theorem
20. Hahn-Jordan Theorem
21. Radon-Nikodym Theorem
22. Almost Sure and Almost Uniform
23. Convergence in Measure
24. Hölder and Minkowski Inequalities
25. L_p Spaces
26. From Convergence in Measure to Convergence in L_p
27. Bounded Linear Operators in L_p
28. Vitali's Covering Lemma
29. Differentiability of Functions of Bounded Variations

30. Absolutely Continuous Functions
31. Decomposition of Distribution
32. Cantor Ternary Set and Function
33. Solution of Exercise 3.2.4
34. Solution of Exercise 6.4.3
35. Solution of Exercise 9.2.3
36. Materials

4.7.2 Functional Analysis

1. Linear Spaces: Definition, Examples and Linear Span.
2. Linear Spaces: Quotient Spaces and Convex Sets.
3. Normed Linear Spaces: Definition and Basic Properties.
4. Completing a Normed Linear Space.
5. Finite Dimensional Linear Spaces.
6. Examples of Normed Linear Spaces.
7. In Infinite Dimensions the Unit Ball is not Compact.
8. Zorn's Lemma.
9. The Hahn-Banach Theorem.
10. Convex Sets and Gauge Functions.
11. Geometric Hanh-Banach Theorems.
12. Dual o a Normed Linear Space.
13. Extension of Bounded Linear Functionals, Closed Linear Spans.
14. Reflexive Spaces.
    (a) The Dual Space of C([a,b]).
    (b) An Application of the Hahn-Banach Theorem: the Moment Problem and Chebyshev Approximation.

(c) A Dual Variational Problem in Optimal Control.

(d) An Application of the Hahn-Banach Theorem: the Existence of a Green Function.

15. Hilbert Spaces.

16. Closed Convex Subsets of a Hilbert Space.

17. Riesz and Lax-Milgram Representation Theorems.

18. Orthonormal Sets and Closed Linear Spans.

19. Orthonormal Bases.

    (a) A Quadratic Variational Problem.

    (b) The Dirichlet Principle.

    (c) Generalized Derivatives and Sobolev Spaces.

20. Uniform Boundedness Principle.

21. Weak Convergence.

22. Uniform Boundedness of Weak Converging Sequences.

23. Weak Sequentially Compactness.

24. Weak* Topology.

25. Applications of Weak Convergence.

26. Bounded Linear Operators.

27. Transpose of Bounded Linear Operators.

28. Strong and Weak Convergence of Operators.

29. Principle of Uniform Boundedness for Maps and Compositions.

30. Open Map Principle.

31. The Closed Graph Theorem.

32. Examples of Bounded Linear Maps: Integral Operators.

33. Symmetric Operators.

34. Eigenvalues of Compact Symmetric Operators.

35. The Fredholm Alternative.
36. An Application to Integral Operators.
37. Materials

4.8 Calculus of Varlations and Optimal Control

4.9 Ordinary and Partial Differential Equations

4.9.1 ODE

1. Some Basic Mathematical Models
2. Separable Differential Equations
3. Linear v.s. Non-Linear Differential Equations
4. Linear First Order ODE
5. Applications of Separable Equations
6. Applications
7. Existence and Uniqueness, Linear v.s. Nonlinear
8. Autonomous First Order ODEs, Population Dynamics
9. Exact Differential Equations
10. Euler's Method
11. Review
12. 2nd Order Linear ODEs
13. 2nd Order Linear Homogeneous ODEs with Constant Coefficients
14. Complex Roots of the Characteristic Equation
15. Reduction of Order
16. Nonhomogeneous 2nd Order Linear Equations, Method of Undetermined Coefficients
17. Variation of Parameters
18. Vibrations

19. Higher Order Linear ODEs
20. Forced Vibrations
21. Linear Independence
22. n-th Order Linear ODEs with Constant Coefficients
23. Variation of Parameters for n-th Order Linear ODEs
24. Method of Variation of Parameters for n-th Order Linear ODEs
25. Systems of First-Order Linear Equations
26. On 2×2 Linear Systems with Constant Coefficients
27. Linear 1st Order Homogeneous 2×2 Systerms with Constant Coefficients
28. Linear Systems with Constant Coefficients
29. 3×3 Systems , Fundamental Matrices
30. Repeated Roots
31. Nonhomogeneous First Order Linear Systems
32. Non-linear 2×2 Systems
33. Competing Species
34. Review
35. Analyzing Non-Linear Systems
36. Damped Pendulum with a Stiff String
37. Predator Prey Equations
38. Laplace Transform
39. Using Laplace Transform
40. Laplace Transform of Picewise Defined Functions
41. Review
42. Review

4.9.2 PDE

1. A. Intro, definitions, elementary examples.

   B. Advection equations. Characteristic lines. General solutions of quasi-linear first order equations.

2. First order quasi-linear PDEs in two variables. Solution surface. Characteristic equations. Cauchy problem. Examples: advection equations and Burgers equation.

3. Burgers equation. Gradient catastrophe, weak solutions, shock formation, properties and propagation.

4. A. Shock waves, weak solutions, speed of propagation in Burgers equation. Conservation laws.

   B. Parametric solution to general first order PDEs. Monge cone. Characteristic equations.

5. Cauchy problem for general first order PDEs. Wave fronts on an ellipse, caustics. ODEs general solution for a linear system.

6. Second order PDEs intro. Wave equation D'Alembert solution. Changes of variables. Characteristic coordinates.

7. Linear and quasi-linear second-order equations. Characteristic curves.

8. Linear second-order equations. Example: Tricomi equations. Elliptic equations.

9. Parabolic linear second order equations. Examples. Rescaling the dependent variable to remove first order terms.

10. A. Elliptic equations. Laplace equation solutions and Cauchy's theorem. On a disk.

    B. Elliptic equations. Laplace equation solutions and Cauchy's theorem. On the upper half plane.

11. Uniqueness theorems, Laplace equation, divergence theorem, separation of variables, mean value theorem.

12. Maximum minimum principle for elliptic equations. Green's functions. Symmetrical solutions, boundary conditions.

13. Symmetry properties of the Green's function. Boundary conditions of the Green's function: Dirichlet, Robin, Neumann.

14. A. Green's function for Laplace equation on a disk.

    B. Green's function for Laplace equation on a rectangle.

15. Diffusion equation, self-similar solutions, uniqueness, min-max principle.

16. Green's function for the heat equation. Infinite and semi-infinite domains, Neumann and Dirichlet boundary conditions.

17. Green's function for the 1D diffusion equation on a finite domain. Wave equation in 2D and 3D, preliminaries. Uniqueness of solutions.

18. Fourier transform properties. Green's function for the wave equation in nD.

19. Green's function for the wave equation in 1D and 2D.

20. Wave equation. Green's function in 3D. Example: Radiation from an electron on an antenna.

21. Separation of variables in 2D. Laplace, Helmholtz, Schrödinger potentials. Separable coordinate systems in 2D.

22. Sturm-Liouville oscillation theory, Prüfer substitution, comparison theorems.

23. A. Sturm-Liouville theorem. Eigenvalue problem. Properties of zeros, dependence on the eigenvalue. Existence of unique orthogonal basis.

    B. Expanding functions on a Sturm-Liouville eigenbasis. Properties and method.

24. Wave equation on a disk, separation of variables.

25. Wave equation on a circular membrane, Bessel functions, zeros, generating function, integral representations.

26. Wave equation on a circular membrane, expansions using Bessel functions.

27. Solitons, Korteweg-de Vries equations. Advection nonlinear velocity, dispersion.

28. KdV travelling wave solutions, self-similar solutions, inverse scattering method, solitons.

5 Statistics

5.1 Probability

5.2 Survival Analysis

5.3 Markov Processes

5.4 Time Series Analysis

5.5 Monte Carlo Methods

5.6 Mathematical Statistics

5.7 Multivariate and Regression Analysis

5.8 Graphical Models and Causal Inference

5.9 High-Dimensional Probability and Applications in Data Science

6 Geometry

6.1 Geometry

6.2 Basic Geometry

6.3 General Topology

6.4 Riemann Geometry

6.5 Manifolds and Tensor Analysis

7 Recreation

7.1 This Is Us

7.2 Vocabulary

7.3 Conversation

1. 1700

7.4 Driving Experience

座椅调节顺序: 上下 → 前后 → 靠背. 方向盘调节顺序: 前后 → 上下. 后视镜调节顺序: 上下 → 左右.

1. 坐姿后视镜调节
2. 自动挡正确起步和停车
3. 方向盘正确打法
4. 踩刹车技巧
5. 新手开车注意事项
6. 开车安全口诀
7. 提升车感
8. 灯光正确操作
9. 新手开车错误习惯
10. 停车技巧
11. 车头车尾距障碍物距离
12. 倒车入库
13. 开车出库
14. 侧方位停车
15. 窄路侧方位停车
16. 靠边停车
17. 掉头
18. 窄路判断车距
19. 农村开车技巧
20. 市区开车技巧
21. 雨天开车
22. 雾天开车
23. 跑高速流程
24. 跑高速注意事项
25. 雨天跑高速
26. 雾天跑高速
27. 雪后跑高速
28. 夏天开车注意事项
29. 冬天开车正确使用空调
30. 手机导航

7.5 The Big Bang Theory

7.6 Romance of the Three Kingdoms

1. 宴桃园豪杰三结义, 斩黄巾英雄首立功
2. 张翼德怒鞭督邮, 何国舅谋诛宦竖

7.7 New Concept English I II III IV Vocabulary and Grammar

8 Computing

8.1 Numerical Analysis

8.2 Numerical Optimization

8.3 Numerical Linear Algebra

8.4 Numerical Partial Differential Equations

8.5 Tensor Decompositions and Their Applications

9 Life Sciences

9.1 Cardiology

9.2 Brain Imaging

9.3 Clinical Neurology

9.4 Biomedical Engineering

9.5 Medical Image Computing

9.6 Fundamental Statistical Genomics

9.7 Machine Learning for Brain Disorders
